andrea.aliverti@polimi.it

Outline

- What does it mean “wearable devices”?
- What does it mean “wearable biomedical devices”?
- What is a digital health ecosystem?
- What and how to measure to assess respiratory function?
- Patient wearables – how effective are they?

Wearable devices

“**Wearable**” means whatever a subject can wear, as sweaters, hats, pants, eyeglasses, bras, socks, watches, patches or devices just fixed on the belt, without encumbering daily activities or restricting the mobility.

The concept of **wearability** is of particular importance in fields like monitoring for healthcare, wellbeing and fitness/sport.

Wearable technology

conventional
'rigid' electronics

more disruptive
'soft' technology
(e.g. apparel and textiles
with distributed functions, in
which electronics is
intimately combined)

Technological trend

lab devices

Handheld/
portable devices

wearable devices
(flexible, e-textile)

attachable devices
(e-tattoos)

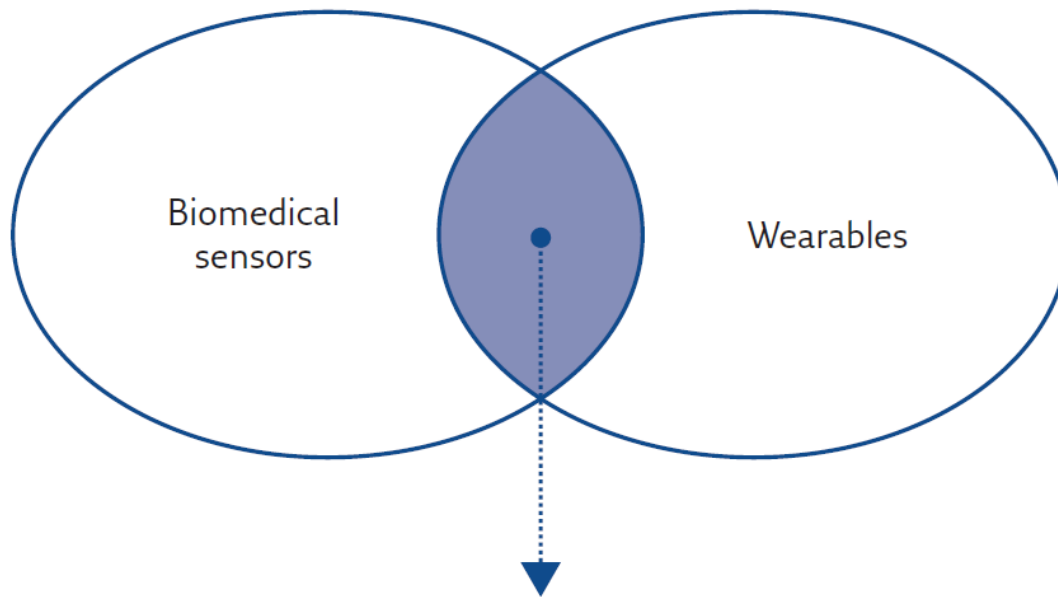

implantable Devices
(under skin)

ingestible devices

- pH
- Temperature
- Pressure
- Motility
- Gas Molecules
- Enzymes
- Inflammatory Markers
- Microbiome
- etc...

Wearable biomedical sensors

Activity trackers

Smart watches

Smart clothing

Patches/
tattoos

Ingestibles/
smart implants

European Medical Device (new) Regulation

The medical device (MD) sector is regulated by Directives 93/42/EC and 90/385/EEC. **From 26 May 2021, the new Regulation 2017/745/EU is fully applied in Europe.**

Classification of medical devices (estimated to be more than 500.000) drives many **pre- and postmarket requirements.**

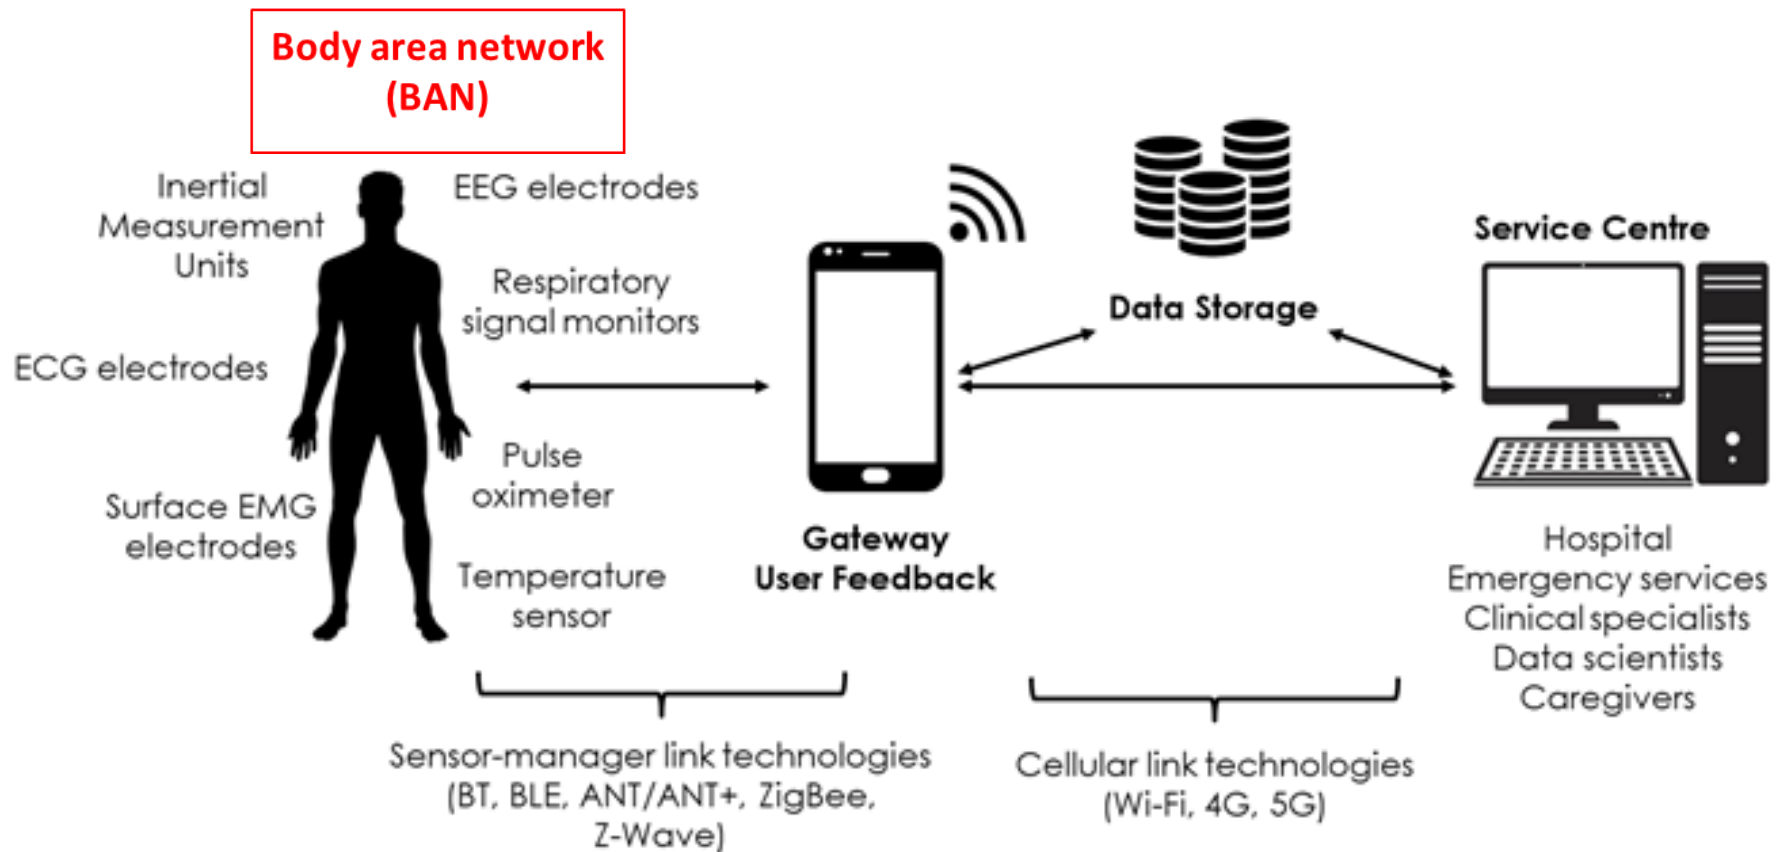

Due to the large variety of products, the level of control made by a thirdparty (the “notified body”) before placing them in the market depends on the level of impact on the human body that their use might imply.

The same notified body is involved post-market to ensure the continued safety and performance of medical devices.

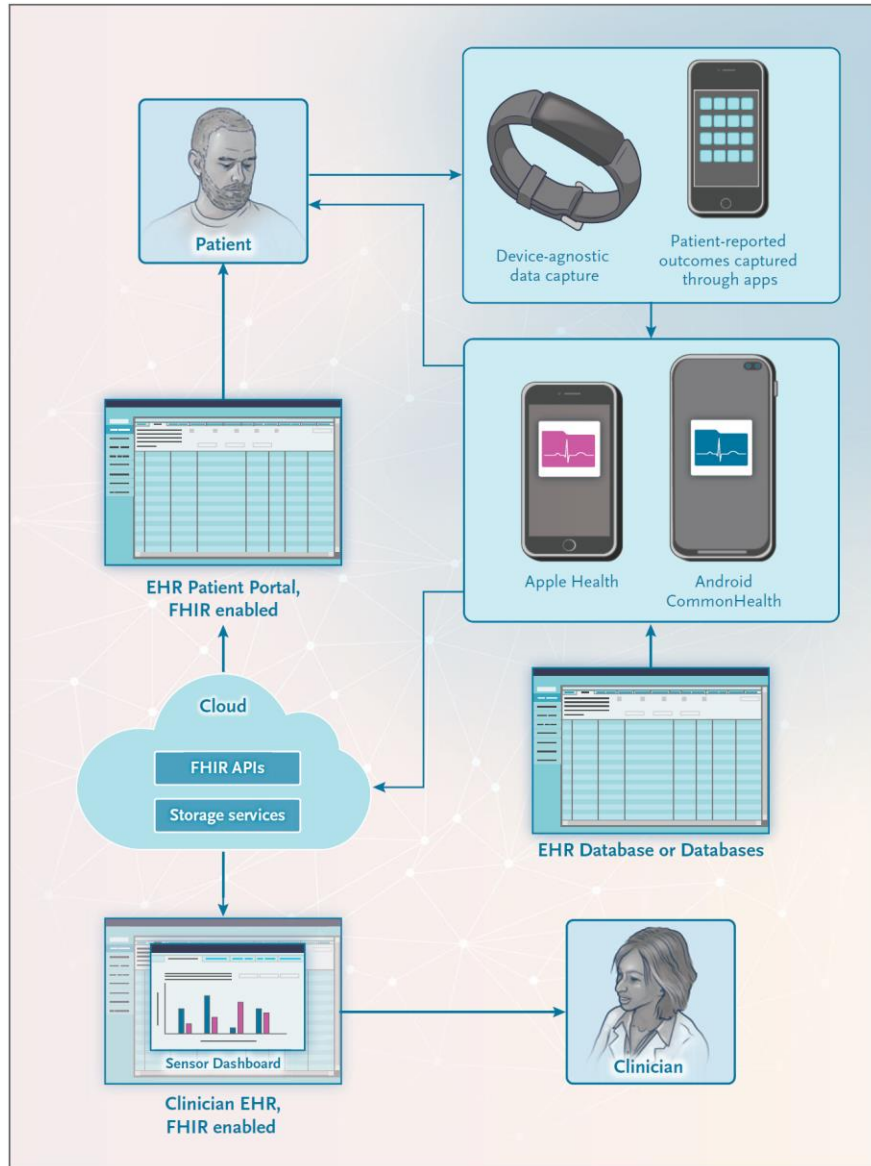

Telemonitoring systems

“two-hop” data transmission architecture

Digital Healthcare Ecosystem

- infrastructure that supports the shift from an organization-centric to a **patient-centric model** of delivering healthcare services using digital platforms to encourage cross-organizational, multidisciplinary, and collaborative healthcare delivery
- the infrastructure comprises an internet platform that offers digital healthcare services. It promotes **interoperability** by allowing intercommunication among healthcare professionals. It also enables the sharing of **Electronic Health Records (EHR)**

Cardiac function

Sensors

Photo-plethysmography (PPG)

Measurements

HR, HRR, HRV, cuff-less BP, SaO2, cardiac output, stroke volume, pulse-based rhythm detection, sleep and its stages

Conclusions

- Consumer-grade wearable sensors have drastically expanded Remote Patient Monitoring (RPM) capabilities to the entire population aiding in early diagnosis and real-time disease management.
- Need of developing solutions which provide medical grade measurements, are certified as medical devices, offers the highest safety to protect patient privacy
- Home monitoring enabled by automated alert systems tailored specifically to the needs of the patient by the provider will be the cornerstone of a more continuous, patient-centric healthcare model.
- Need of studies to study effectiveness
